## Direction for Q. Nos. 17 to 20.

Read the passage carefully. Select your answer from the four alternatives given below against each question.

Bacteria vary tremendously and have a great ability to adapt themselves to circumstances. It is this quality which enables them to develop resistance to some antibiotics, like penicillins, and so defeat our attempts to overcome them. Fortunately, our own system is also able to adopt whatever drugs are given, it is always the body's own resources that beat the enemy in the end. Man's skill in evading infection is very often not to his credit at all, for many bacteria much prefer to keep well out of harm's way and remain free living in the open air. Others live in complete harmony inside the body tissues taking care not to disturb their protector, so that the body which shelters them is never provoked sufficiently to retaliate and expel them.
